

ABSTRACT OF THE DISCLOSURE

An assembleable recording and playback device for assembly and cooperative engagement in combination with a display unit for gifts such as vase providing a more personalized presentation for flowers and gifts from givers to receiving parties. The device features a plurality of recording and playback units which cooperatively engage with a plurality of different functional and ornamental display units such as vases and gift boxes. From a remote location, a person may call and record a personal message which is placed on the appropriate recording and playing device which is then cooperatively engaged with the appropriate ornamental display unit such as a vase. The assembled device can then be delivered with flowers or their gift anywhere in the world on the same day it is ordered with the personal message which plays when a drawer is opened. This new and unique invention also offers a means whereby individuals may record personal messages which will be placed in memory of a playback unit through an electronic interface to a telephone or microphone allowing for remote recording from distant locations.
